A time machine for your eyes

Our hospital-quality OCT (optical coherence tomography) scan can help detect treatable eye conditions such as diabetic retinopathy and macular degeneration sooner than traditional imaging methods. It can also help detect glaucoma up to four years in advance. This means conditions can be managed before they get worse and can help prevent potential sight loss. It only takes a few seconds and allows us to look deeper into your eyes than we ever have before.

Every picture tells a story

An OCT scan uses light to take over 1,000 images of the back of your eye and beyond, looking right back to the optic nerve. A layered image is created that gives us an incredibly accurate picture of your eye and its structures, allowing us to check your eye health and the images will then be stored so we can note changes over time.
